

F. William Engdahl Explains the Rockefeller Origins of GMOs and Their Role in Population Reduction

Author and Researcher, F. William Engdahl, describes how the Rockefeller family funded molecular biology to create new species. He says the so-called 'green revolution' was developed at Harvard Business School in the 1950s with Rockefeller funding. The goal was to replace small, independent farms with large, corporate farms producing single crops. The Rockefellers and Rothschilds are involved in this primarily because of their fascination with eugenics, which is the science of population control through selective breeding, sterilization, and reduction of fertility rates. -GEG
