

The US Government Is the Leader of Genetic Extinction Technology

written by GEG | December 12, 2017

David Knight reports that the US Department of Defense has been collecting the DNA of people from Russia, and it has been theorized that this is part of developing a genetic-extinction technology to be used as a military weapon. The *Guardian* published a story confirming that the secretive Defense Advanced Research Projects Agency (Darpa) is, indeed, working on genetic-extinction technologies that could wipe out malarial mosquitoes, invasive rodents or other species, including humans. If they could advance the technology to the point where races and sub-species could be targeted, it could turn into a monstrous weapon. Between 2008 and 2014, the US government spent \$820 million on synthetic biology, which is a category large enough to include genetic-extinction technology. There is no oversight or ethical considerations for genetic experiments.
