

# Boy Scouts of America Will Require Availability of Condoms at Jamboree

Condoms will be available at medical facilities for attendees of the 2019 World Scout Jamboree in West Virginia to comply with the guidelines handed down by the World Organization of the Scout Movement. Earlier this month, the Boy Scouts organization allowed girls to join, and the name was changed to Scouts BSA. -GEG

Condoms will be available at medical facilities for attendees of the 2019 World Scout Jamboree in West Virginia, to comply with guidelines handed down by the World Organization of the Scout Movement.

The guidelines have been in place since the 1990s, [according to Snopes](#), and Scouts BSA, formerly known as the Boys Scouts of America, confirmed to The Daily Caller Tuesday that the 2019 event will adhere to the “existing health requirements.”

“Given that the vast majority of the attendees, adults and youth, male and female, will be from all over the world, the 2019 World Scout Jamboree host countries arranged with WOSM so that the host facility could adhere to the existing health requirements developed to address the needs of international health norms in a manner more aligned with local practices by making condoms available through the medical facilities,” a Scouts BSA spokesperson said in a statement.

## Did Fracking Cause the Hawaii Volcano Eruption?

Hawaii: Jon Rappoport makes the case that the Kilauea volcano in Hawaii was triggered by geothermal drilling by the Puna Geothermal Venture (PGV) Plant, which is only a few miles from the volcano. Geothermal deep drilling is similar to fracking in that the injection of cold water into hot rocks causes steam to fracture rocks, a process that, not only frees up the flow of oil deposits and the transfer of heat, but also can trigger earthquakes or, in this case, volcanic eruptions.-GEG

On the Big Island of Hawaii, where the Kilauea volcano has explosively erupted, there is a geothermal energy plant. It is the Puna Geothermal Venture (PGV) Plant, in Puna.

There is a long-running debate about whether PGV is fracking. The debate may be a matter of terminology, because in the geothermal process, as hawaiiifracking.com reports, "...the drilling and the injection of cold water into hot rocks used in geothermal energy plants does fracture the rocks, which can induce earthquakes and through contamination of the atmosphere and water tables can affect our health and safety."

Whether deep injection of fluid aims to capture oil, gas, or heat (geothermal), the beginning stage of the process is the

same.

Earthquakes induced by this water-injection could obviously trigger a volcano.

For example, here is an alarming article about a geothermal project in Switzerland. Swissinfo.ch, December 10, 2009: "The authorities in canton Basel City say they will cancel a geothermal energy project, which three years ago caused minor tremors that damaged many buildings."

"A risk analysis study published on Thursday found that the danger of setting off more earthquakes was too great if drilling at the site resumed."

"The project was put on hold three years ago after thousands of claims for damage were filed with insurers. Total costs for the damage were around SFr9 million (\$8.78 million)."

"The study, commissioned by the canton, concluded that Basel was 'unfavourable' for geothermal power generation."

"It said the resumption of Deep Heat Mining project and its operation over a 30-year period could set off around 200 tremors with a strength of up to 4.5 on the Richter Scale – in 2006, the quakes were about 3.4."

"This would result in damages up to SFr40 million."

"The Basel facility drilled five kilometres into the earth. The borehole was designed to be injected with water to capture the extreme heat. Back at the surface, the hot water – at a temperature of around 160° Celsius – would run a steam turbine coupled with a generator."

This Swiss article outlines the risks, and also confirms that deep water-injection is used in the geothermal process—which can and does trigger earthquakes.

# New DARPA Pentagon Program Plans to Patrol Cities with AI Drones

The Pentagon is developing a program of high-tech cameras mounted on drones and other robots to monitor cities and identify civilians and terrorists through machine learning computers, or artificial intelligence (AI). The new program is named the Urban Reconnaissance through Supervised Autonomy (URSA). It is believed that Google's Project Maven is being used to speed up the analysis of the drone footage.

On May 10, the Defense Advanced Research Projects Agency (DARPA) [unveiled](#) the Urban Reconnaissance through Supervised Autonomy (URSA) program, which addresses the issues of reconnaissance, surveillance, and target acquisition within urban environments.

The primary

objective of the URSA program is to evaluate the feasibility and effectiveness of blending unmanned aerial systems, sensor technologies, and advanced machine learning algorithms to “enable improved techniques for rapidly discriminating hostile intent and filtering out threats in complex urban environments,” said [FedBizOpps](#).

In other words, the Pentagon is developing a program of high-tech cameras mounted on drones and other robots that monitor cities, which enable identification and discrimination between civilians and terrorists through machine learning computers.

DARPA provides a simple scenario of what a URSA engagement would look like:

*“A static sensor located near an overseas military installation detects an individual moving across an urban intersection and towards the installation outside of normal pedestrian pathways. An unmanned aerial system (UAS) equipped with a loudspeaker delivers a warning message. The person is then observed running into a neighboring building. Later, URSA detects an individual emerging from a different door at the opposite end of the building, but confirms it is the same person and sends a different UAS to investigate.*

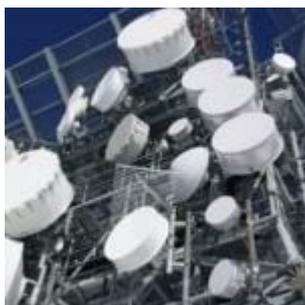

*This second UAS determines that the individual has resumed movement toward a restricted area. It releases a nonlethal flash-bang device at a safe distance to ensure the individual attends to the second message and delivers a sterner warning. This second UAS takes video of the subject and determines that the person’s gait and direction are unchanged even when a third UAS flies directly in front of the person and illuminates him with an eye-safe laser dot. URSA then alerts the human supervisor and provides a summary of these observations, warning actions, and the person’s responses and current location.”*

The URSA program is a two-phase, 36-month development effort.

The first phase of concept/development will begin in the first quarter of FY19 and continue into the second half of FY20. Phase two will start in 3Q20 and continue through 2Q22.

## **5G Rollout: 100 Billion Devices Connected to the Internet for Global Control**

New report warns of electromagnetic radiation from power lines, wi-fi, phone masts and broadcast transmitters that threaten wildlife amid growing health concerns over the rollout of 5G small-cell transmitters and antennas. 237 scientists have signed an appeal to the United Nations asking them to take the risks of electromagnetic radiation more seriously. The goal is to have 100 billion new devices online connected to the internet to be monitored by an energy authority for global control.

Electromagnetic radiation from power lines, wi-fi, phone masts and broadcast transmitters poses a 'credible' threat to wildlife, a new report suggests, as environmentalists warned the 5G roll out could cause greater harm.

An analysis of 97 studies by the EU-funded review body EKLIPSE

concluded that radiation is a potential risk to insect and bird orientation and plant health.

However the charity [Buglife](#) warned that despite good evidence of the harms there was little research ongoing to assess the impact, or apply pollution limits.

The charity said 'serious impacts on the environment could not be ruled out' and called for 5G transmitters to be placed away from street lights, which attract insects, or areas where they could harm wildlife.

Matt Shardlow, CEO of Buglife said: "We apply limits to all types of pollution to protect the habitability of our environment, but as yet, even in Europe, the safe limits of electromagnetic radiation have not been determined, let alone applied.

## **Canada: Migrant Crisis Leads to Fighting in the Streets as Police Stand Down**

Last year, Canadian Prime Minister Justin Trudeau invited all self-professed "refugees" to his country via Twitter,

effectively opening the borders without any vote or debate. Activist Faith Goldy visited the primary point of entry on the southern border of Quebec and upstate New York, and was spat upon and attacked by Antifa and other pro-immigration extremists. Police in riot gear stood down and just watched. She is afraid that the migrant crisis is overwhelming her country and dividing people to the point that it could lead to civil war.
