

California Halts Use of Moderna Covid Vaccine Batch Due to 'Higher-Than-Usual Number of Adverse Events'

written by GEG | January 20, 2021

A vaccination super station in San Diego was the site of an “unusually high number” of adverse reactions from Moderna’s RNA vaccine, Lot 041L20A, leading to an order by California state epidemiologist Dr. Erica Pan and the California Department of Public Health to stop using that specific lot. San Diego County reported that allergic reactions were detected in six vaccine recipients. The center reportedly closed for several hours after the string of adverse reactions occurred, before switching to a different batch of the drug. The media discounts the risk of the experimental vaccine. Moderna confirmed that a total of 1,272,200 doses were produced in the batch, with nearly a million doses already distributed across the US. The lot was shipped between January 4th and January 8th, and thus it expects that a significant portion of the distributed doses have been already used.

Information from the vaccine injury reporting system of the Centers for Disease Control and Prevention (CDC) indicates the first dose alone of the experimental coronavirus vaccines is causing many times more adverse reactions than flu shots cause.

There were delays and some people were turned away at San Diego’s new “Vaccination Super Station” near PetCo Park on Wednesday after, in a short time period, six people had allergic reactions after receiving their experimental coronavirus vaccine shots.

In addition, the unused portion of the lot of the vaccine from which the shots came was pulled from distribution. That suggests thinking that there may be something particularly dangerous about that lot.

This gives a whole new meaning to “drawing lots.”

Watch and read [here](#) an NBC 7 report on the vaccination trouble.

In the video report from NBC 7, a woman who had an allergic reaction and a four-hour hospital stay after receiving the first shot of the two-shot vaccination regimen on Wednesday at the Vaccination Super Station is interviewed. She says she feels fatigued and sore. She also says she does not want to have a second shot even though she has taken other vaccines throughout her life, including a flu vaccine recently. "I can't go through that again," she states.

Who could blame her? Initial studies from drug companies that created the experimental coronavirus vaccines indicate side effects tend to be worse after the second shot.

Information from the vaccine injury reporting system of the Centers for Disease Control and Prevention (CDC) indicates the first dose alone of the experimental coronavirus vaccines is causing **many times more adverse events** than flu shots cause.

Interestingly, there seemed to have been some evasion when NBC 7 sought information about the delay at the Vaccination Super Station. Here is how that is described in the TV station's written report:

Just after 11 a.m., NBC 7 confirmed that some people waiting for their vaccines at the site at Tailgate Park were experiencing delays. Others said they had been turned away.

NBC 7 reached out to those running the station; a representative said the delay was about an hour long due to logistical issues having to do with more doses of the vaccine arriving at the location.

During the county's weekly COVID-19 briefing, Dr. Eric McDonald, Director of Epidemiology for the county, said vaccinations were slowed down after allergic reactions were detected in six vaccine recipients.

Fortunately, more of the story of the vaccination problem did come out. It makes one wonder how often similar problems are successfully hidden from media and the public.
