

# Bombshell: CDC Counts Those who Die within 14 Days of a Covid Jab as Unvaccinated!

Mainstream media is frightening people into taking Covid vaccines by promoting a study by the CDC that claims that Los Angeles County residents who are unvaccinated are 5 times more likely to get Covid and are 29 times more likely to be hospitalized than those who took the jabs. However, the definition of 'unvaccinated' is deceptive. The study defines unvaccinated as having received a first-dose vaccine up to 14 days prior. That means, if someone was hospitalized, admitted to ICU, required mechanical ventilation or died within two weeks of getting the jab, they are counted as 'unvaccinated.' This intentionally misleading data is now being used as justification for vaccine mandates and passports nationwide. It also fraudulently lowers the number of deaths and injuries linked to the Covid vaccines. -GEG

A new Centers for Disease Control and Prevention (CDC) study is being used by mainstream media to fearmonger Americans into taking Covid vaccines.

*Yahoo Finance* published an article with the headline, "Unvaccinated LA residents were 29 times more likely to be hospitalized with COVID-19: CDC study."

Citing the Los Angeles County Morbidity and Mortality Weekly Report released on Tuesday, even local news promoted the claim that "Unvaccinated L.A. County residents [are] 5 times more likely to get COVID, 29 times more likely to be hospitalized."

Looking at a screenshot of the CDC release, one can observe the definitions for what they consider “fully vaccinated,” “partially vaccinated,” or “unvaccinated.”

According to the chart, “unvaccinated <14 days receipt of the first dose of a 2-dose series or 1 dose of the single-dose vaccine or if no vaccination registry data were available.”

This means if someone was hospitalized, admitted to ICU, required mechanical ventilation or died within two weeks of getting the jab they are being counted as “unvaccinated.”
