

Scientist Identifies Toxic Batches of Covid Vaccines and Creates 'How Bad Is My Batch?' App

written by GEG | December 26, 2021

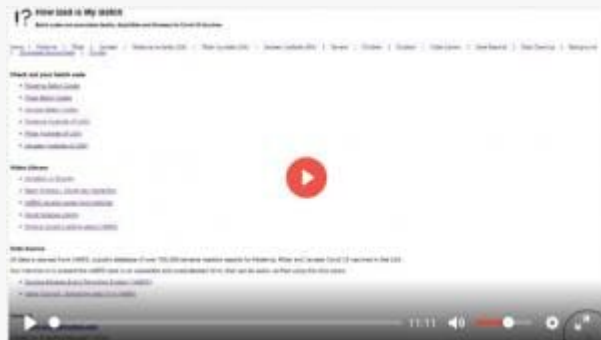

Craig Paardekooper, a scientist at Kingston University London, analyzed massive amounts of data from the American CDC's Vaccine Adverse Event Reporting System (VAERS) that tracks reports by the public of vaccine injuries and deaths linked to Moderna, Pfizer and Janssen/J&J Covid vaccines. He says that the three companies are intentionally using differing formulas, instead of uniform formulas, as they have falsely presented to the public. There are over 20,200 different batches (lots) of Pfizer, Moderna and Janssen injections in total. He discovered that 1 in 200 lots contain deadly ingredients and that the risk of death or vaccine injury is about 1 in 200. Paardekooper urged people to share his videos and app 'How Bad Is My Batch?' with doctors and nurses so that they may check toxicity levels of certain batches before they inject people, especially children.

This short video shows that vaccine batches are not uniform with graphs. Vaccines that are distributed in numerous states and show patterns in number of injuries suggest that the cause of the reactions is not the demographics or personal health of the recipient, but is the vaccine. The toxic batches are consistently causing adverse reactions, hospitalizations, disabilities and death across the USA in every state.

UK Scientist Reveals Bombshell Data Analysis: Tracks Batches Of Pfizer, Moderna and Janssen, Finds “..Some Batches Are 50 Times Worse Than Others”

I was told about the work of Craig Paardekooper by my friend of many years, PhD bio-chemist Dr. Dave Rasnick a few days ago; Today came this email from Dave, clarifying his shocking findings:

“ I’m following the very important work of Craig Paardekooper at Kingston University London. Recently, I introduced Craig’s work to our email group.

Three of his conclusions:

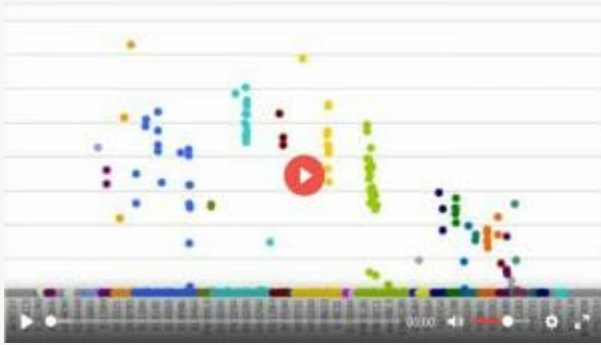

- The companies purposely manufactured non-uniform formulations of their vaccines while representing to the public that all COVID-19 vaccines from a given manufacturer were uniform in their formulation.
- Over 20,000 different batches (lots) of Pfizer, Moderna, J & J injections total.
- 1 in 200 lots contain deadly ingredients. He urged me to watch a series of videos, in which he lays out the unthinkable. One video [here](#):
Another, “Death By Alphabet: Moderna Batch Codes And Associated Deaths:” [here](#)

“Please share with those you know, and also with doctors, nurses and teachers – who may soon be pushing the vax onto children. Doctors and nurses need to see that some batches are 50 x worse than others – before they prescribe them.”

–Craig Paardekooper, Telegram

This last video illustrates that Pfizer appears to use adverse reactions as an index of toxicity and certain ranges of toxicity. Paardekooper suggests that Pfizer's codes are not random, but were purposefully used to indicate toxicity as they are in a continuous mathematical sequence, as is standard for medical experiments.
