

UN World Health Organization Uses COVID as Excuse for 'Enhanced Surveillance'

written by GEG | July 4, 2022

The World Health Organization (WHO) is calling for governments to provide 'enhanced surveillance' tracking in order to detect phony COVID-19 variants that they claim are circulating in every country. In addition, a study claims that wrist-worn trackers such as Fitbit can detect whether users have COVID-19 even before symptoms appear. It is hard to believe that tracking devices can detect COVID-19 when a valid test to detect COVID-19 does not exist.
