

Tulsi Gabbard Says that Puberty Blockers Promoted by Biden Admin Are Child Abuse

written by GEG | August 9, 2022

Early in July, the FDA added a warning to multiple gonadotropin-releasing hormone (GnRH) drugs that are often used as puberty blockers in gender-confused youth. The drugs can cause pseudotumor cerebri that produce symptoms such as headaches, blurred vision, tinnitus and more. Meanwhile, the Biden administration has endorsed sex change operations and treatments for kids who suffer from gender dysphoria, including treatment with puberty blockers. Gender-related distress will alleviate for around 80% of pre-teen children once they become teenagers, according to these [studies](#). Former Congresswoman Tulsi Gabbard said that the Biden administration's advocacy for puberty blockers and irreversible surgeries on children is promoting child abuse.

From the Daily Caller:

Early in July, the Food and Drug Administration (FDA) added a warning to multiple gonadotropin-releasing hormone (GnRH) agonists, drugs often used as puberty blockers in gender-confused youth.

The FDA identified six cases where there was a “plausible” link between GnRH agonists and a condition called *pseudotumor cerebri*, which is caused by elevated fluid pressure in the brain. According to the FDA, all six cases were identified in biologically female children between the ages of 5 and 12; five of the six were being treated for early puberty, and the sixth was undergoing “transgender care.”

The drugs, which were flagged by the FDA, include Lupron Depot-Ped, Fensolvi, Synarel, Supprelin LA, and Triptodur. These types of drugs are commonly used to treat precocious puberty (early-onset puberty) in children, and can also be deployed as part of “gender-affirming” care, which involves facilitating sex changes for children, according to the Mayo Clinic.

Symptoms of *pseudotumor cerebri* include headaches and blurred vision which can worsen over time. The condition can lead to loss of vision if not promptly treated. The warning recommends that children taking GnRH agonists be monitored for headaches, blurred vision, pain behind or within the eyes, tinnitus, dizziness and nausea.
