

US Forests Clearcut to Supply EU with Fuel. Germany Prepares to Turn Off Its Power

written by GEG | August 11, 2022

Oil is abiotic and is created by non-biological processes in the Earth's mantle (40 to 90 miles below the surface), which explains why empty wells can refill. It is a renewable resource. Those in power are shutting down the oil industry, which will cost millions of lives, maybe more. The EU and Britain have reverted back to burning wood as fuel and nearly 40% of Europe's renewable energy is wood, and the majority comes from the United States. Germany has shut down 11 out of 17 nuclear plants, and the rest are scheduled to be shuttered by the end of this year, leaving the people vulnerable to the cold in winter.
