

Company Converts Digital Data into Strands of DNA Placed into Spores and Sprayed on Food to be Tracked

written by GEG | May 3, 2021

Aanika is a company that created a genetically modified organism probiotic spore that can be misted onto dry goods or added to liquid products so that the spores can be traced. The spores added to food will be tracked from the field to the store, to your stomach, and finally to the smart sewers for total surveillance.
